

Frontier AI for Actuaries.

AI helps actuaries perform complex, multi-step actuarial tasks with every step documented and reproducible.

THE WORKBENCH

One collaborative workspace for pricing, reserving, and filing

For all actuaries at admitted and specialty carriers, MGAs,
and reinsurers.

August 2026
CONFIDENTIAL

Actuarial work is not one workflow. It is a web of intricate, connected tasks.

The more steps an actuary delegates to AI, the less certain they can be of the output. Tesora enables full tracing, documentation, and audit, so the actuary remains in control.

Philo Bishay ✓ • 1st

Cofounder & Head of Product @ Tesora | Actuarial | Wharton MBA

2W • 1

Every actuary dreads one question, "What do actuaries do?" I am happy to say we are no closer to an answer, but if you want to avoid further questions, send this:

What Actuaries Deliver

Two questions. All decisions.
What do we charge?
What do we already owe?
Actuaries own both.

AT A GLANCE
10 Major Deliverables
41 Branches
163 Leaves
121 Pricing Leaves (74%)
42 Reserving Leaves (26%)

RESERVING
~1/3 of the tree

Note: Admitted and non-admitted describe the paper, not the company, since filing status is decided state by state and risk by risk, and a single carrier group routinely runs both lines at once. Freedom of rate and form is freedom from rate filing; not freedom from rate regulation: surplus lines carriers remain subject to unfair discrimination statutes, to state adoption of the NAIC AI model bulletin, and to their domiciliary regulator, reinsurers, and auditors.

PRICING

(What Do We Charge?)

Over 150 workflows are core to the actuarial function

■ 121 pricing ■ 42 reserving

one mark per workflow

Ingest

Indication

Filing

One weak handoff and everything downstream is unusable.

This is not a get-one-thing-right problem.

A rate filing or a booked reserve needs dozens of these correct, in sequence, each one feeding the next. Automate a single step and the chain still breaks at the handoff after it.

One agentic harness across all of it

A system of agents keeps every task linked and every value cited, from ingest to filing. That orchestration is the hard part to build, and the harder part to replicate.

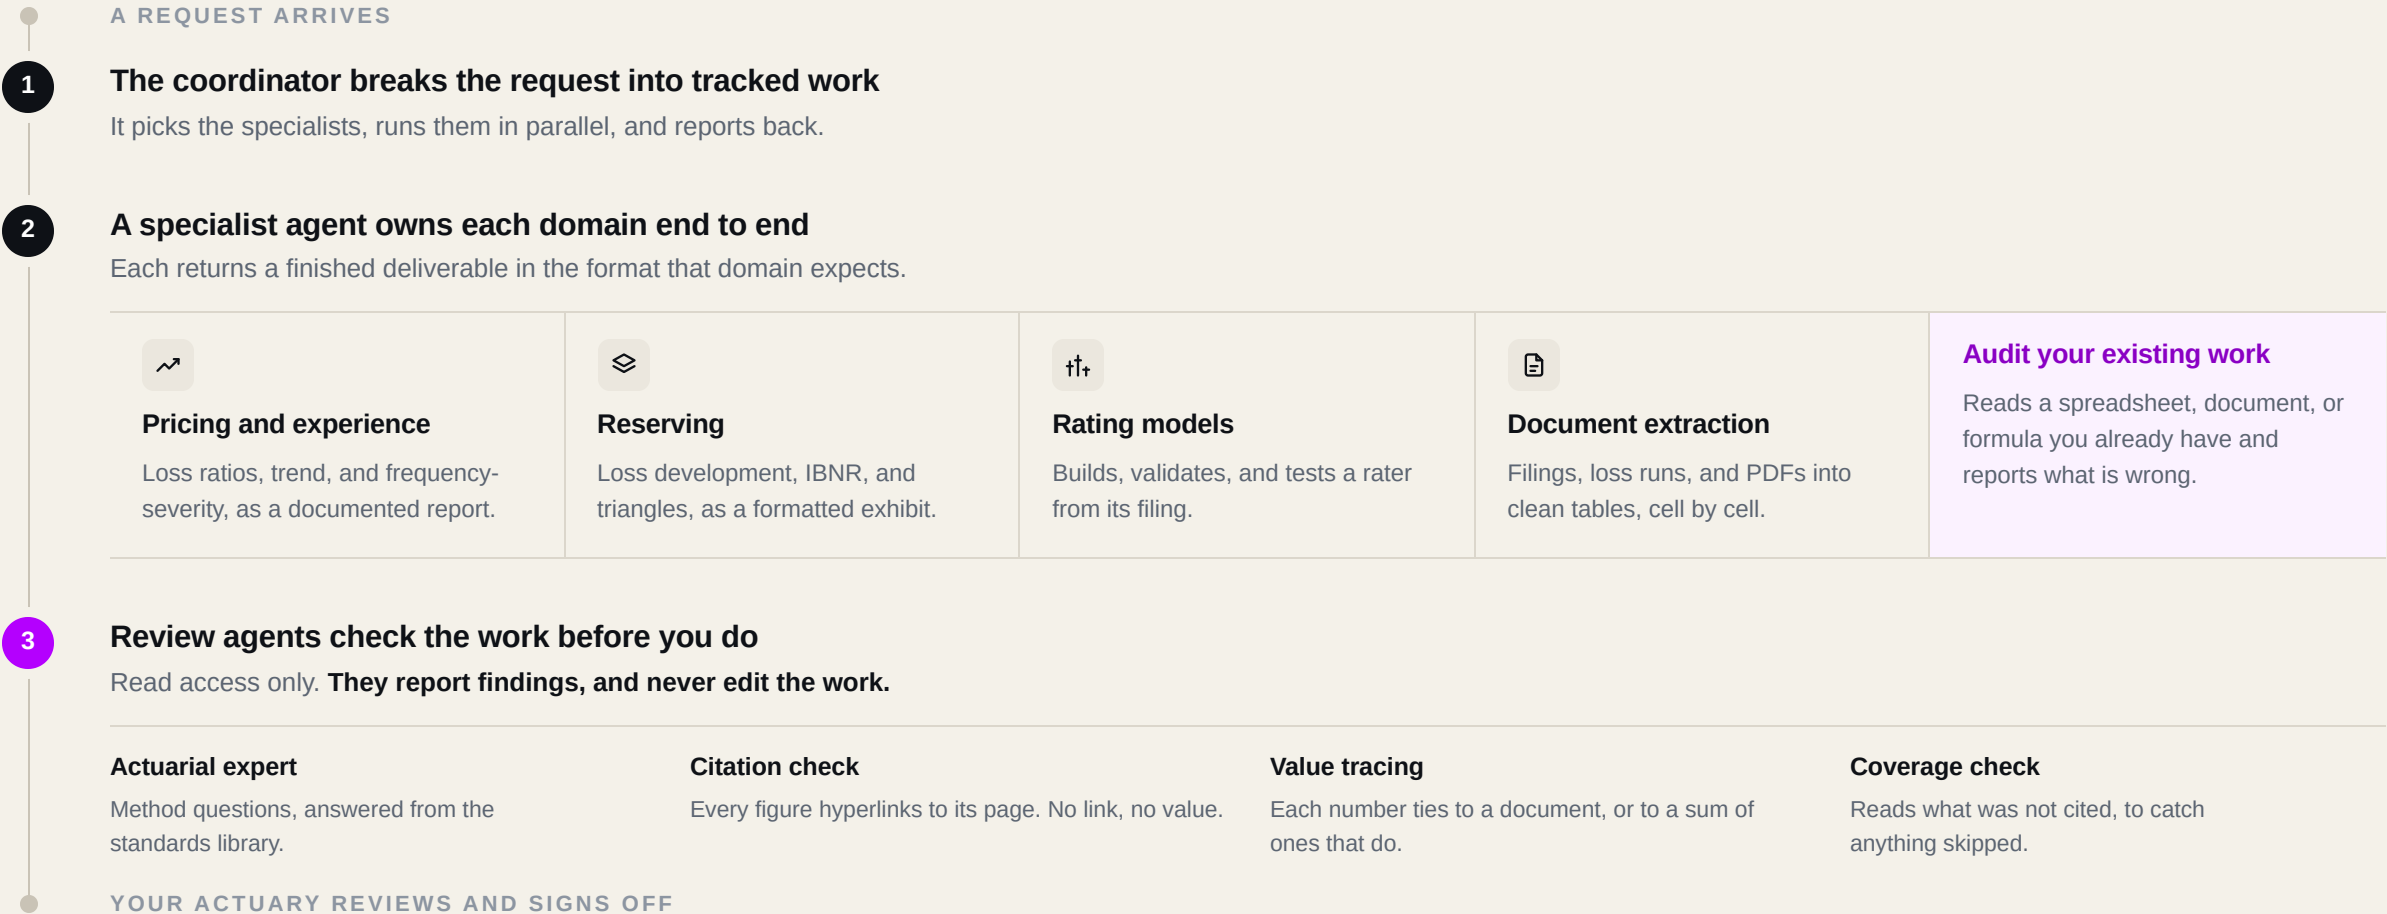

Federico Reyes Gómez and 675 others

23 comments • 28 reposts

No single agent does the whole job, and **none of it reaches you unchecked.**

We watched how actuaries actually do the work, mapped it into sub-agents, and wrote evals for each one, with audit agents sitting behind them. In a domain this intricate, that is what delivers a business outcome without a hallucinated number or a botched handoff between steps.

Rate changes in **days**, not months.

Source a rater from a SERFF filing, an Excel file, or a script. Tesora rebuilds it, tests it, and deploys it whenever underwriting is ready.

BEFORE: BY HAND

4-6 months

From a requested change to a filed, live rater, and where the months actually go

- | | | |
|----|---|-------|
| 01 | Spec the change
Actuary writes up the revised rates and factors | DAYS |
| 02 | IT ticket, then the queue
The change waits for developer capacity | WEEKS |
| 03 | Re-code the rater
Engineering reimplements the logic by hand | WEEKS |
| 04 | Rebuild exhibits, 50 states
Each state reformatted by hand for SERFF | WEEKS |
| 05 | Manual QA
No test suite, so regressions are caught by eye | WEEKS |
| 06 | Compliance sign-off
Actuarial and legal review the filing | DAYS |
| 07 | File and answer objections
Back and forth with each department of insurance | WEEKS |
| 08 | Release window
Deploy only in the next scheduled window | WEEKS |

AFTER: ON TESORA

1-2 days

Deploy to a GUI, an API, or back into Excel.

You give: a plain-language change and the source rater, from SERFF, Excel, or a script.

You get: a tested rater with a working GUI, sample ratings, a versioned API, or an Excel file your team can open.

← Back to list Version 23 DEVELOPMENT

Inputs Computations Memo Review (23) Deployment

GUI Sample Ratings (15) Governance API

GUI template is valid ⚠

Georgia Commercial Auto — Trucks/Tractors/Trailers

Liability + Physical Damage rating with zone-rated Long-Distance segment

Vehicle & Classification	
Territory *	Size Class *
101	Heavy Trucks
Business Use *	Radius *
Commercial	Local
Secondary Class *	Fleet *
Not Otherwise Specified — Other	No (Non-Fleet)

Final Premium **\$3,610.00**

The triangle is squared before you sit down.

A quarterly close moves between actuarial, IT, and finance, and most of the calendar goes to assembling the data rather than judging it.

BEFORE: BY HAND

~2 weeks

From close to a booked IBNR, and who is waiting on whom

01 Request the data

IT

Actuarial files a ticket for the quarter's extract

02 Wait on the extract

DAYS

The pull sits behind other reporting work

03 Reconcile to the ledger

FINANCE

Paid and incurred tied back to finance, by hand

04 Rebuild the triangles

DAYS

Segment mapping and large-loss carve-outs redone each quarter

05 Select factors and methods

ACTUARIAL

Chain ladder, Bornhuetter-Ferguson, Cape Cod, tail

06 Rebuild the exhibits

DAYS

Roll-forward and movement memo reformatted by hand

07 Peer review

DAYS

A second actuary retraces the work from scratch

08 Book and explain

DAYS

Answer the CFO, the auditor, and the board

AFTER: ON TESORA

3-4 hours

Triangles squared on ingest, so the quarter starts at the selection

You give The loss run, as it comes out of the system.

You get Reconciled triangles, method comparisons, and an IBNR with every value traced to source.

Rebuild what a competitor charges, then price your book through it.

A filing gives you tables, rules, and inputs rather than a working model, and the order of operations is rarely spelled out. Turning that into something you can run your own risks through is the work.

BEFORE: REBUILT BY HAND FROM SERFF

~1 week

From a competitor filing to a usable read, and where it goes wrong

- | | |
|---|---------|
| 01 Pull the filings | HOURS |
| An analyst searches SERFF, state by state | |
| 02 Read the rate manual | DAYS |
| Rules, factors, and order of operations, by eye | |
| 03 Rekey the rate tables | DAYS |
| Hundreds of tables retyped into a spreadsheet | |
| 04 Rebuild the algorithm | DAYS |
| The logic is inferred, then argued over | |
| 05 Price a sample | HOURS |
| A dozen test risks, never the real book | |
| 06 Compare by hand | DAYS |
| Deltas built in a one-off workbook nobody owns | |
| 07 Explain the gaps | DAYS |
| Each difference traced back to a single factor | |
| 08 The read goes stale | ONGOING |
| They filed again while you were rebuilding | |

AFTER: ON TESORA

10-15 minutes

An executable competitor rater, and your whole book priced through it

You give A competitor, a state, and a line. Or the SERFF filing itself.

You get Their rating logic running against your risks, every factor cited to the page it came from.

Built from public rate filings, and any additional data sources you provide.

The full context is baked into the work.

Every session holds the data it used, the assumptions behind it, and the reasoning that got there. Reopen it years later and nothing has to be reconstructed, because the context was never separate from the answer.

The screenshot displays the Tesora platform interface. On the left is a sidebar with navigation options: Home, Work Tracking, ARTIFACTS (Folders, Reports, Raters, Routines), APPS (Compute St..., Underwriting, Rater Recon..., Competitive ..., GLM Studio, Triangle Bull..., All Apps, Support, Settings), and a user profile for 'vivek'. The main area is titled 'EXAMPLE Bernegger 2024 — Integrated experience/exposure rating (ASTIN) EX-VLT-bernegger-2024-integrated-rating'. It features a 'Rate Rule Form' table and a document viewer.

Rate Rule Form	
Profit & Contingencies	7.0% ↑ See previous prompt
Total expense & profit load	47.0%
Expected Loss & LAE Ratio (ELR)	53.0%
Projected Ultimate Loss Ratio	54.7%
Adequacy margin (ULR – ELR)	1.7% short

Read: the thin spot is the **47% load** (30 pts of it commission), and the book runs ~1.7 pts past its permissible loss ratio — a modest inadequacy with no cushion.

Caveat (carried from the exhibit): ILFs are relativities, not dollar prices; no competitor base rates or retention/deductible tables exist in the folder. Preliminary analyst work product, subject to credentialed-actuary review.

The full CSV is downloaded at [CIC_vs_Peers_ILF_Competitive_Benchmark.csv](#), and the narrative report is [CIC vs Cyber Peers — ILF & Competitive Benchmark ...](#). Want me to render this as a styled Excel exhibit, or open the report next?

CONTEXT Bernegger 2024 — Integrated...

Ask me anything...

The document viewer on the right shows a PDF titled 'bernegger-2024-integrated-experience-exposure-rating.pdf'. It includes a 'Download' button and metadata: Origin (User upload), Type (application/pdf), Size (1.5 MB), Status (pending), Uploaded (Aug 7, 2026, 06:57 PM), Document ID (DOC-5c0c8dfe-1a3a-4eeb-8c76-5ab1947ac4dd), and File ID (54238c79-b072-45c7-92cb-096cfb81f242). The document content is a research article titled 'Generic framework for a coherent integration of experience and exposure rating in reinsurance' by Stefan Bernegger.

Implementation

The models are wired into your loss runs, policy systems, and ledger, running inside your own environment.

Governance

Author, reviewer, and approver are separate identities, and the trail survives every promotion. Finance and IT find what they need without waiting on an actuary.

Compliance

Built to ASOP from the start, and SOX-aligned for carriers with public-company parents. Same input, same answer, every time.

Continuity

When an actuary leaves, their assumptions, sources, and reasoning stay in the session. The next person picks up the thread.

Every request from the platform pings our chief actuary and CTO. Support is agents and people, so you are never left with a bot. A real person is available within two to three minutes on average, and we have had no unplanned downtime to date, which is the routing approach doing its job.

What's the best way to implement AI?

Your implementation of AI today will dictate its value, translatability, and reproducibility going forward.

	Actuarial consultants Milliman, WTW, Oliver Wyman	Your team with AI In-house, on ChatGPT or Claude	Actuarial software hyperexponential, Earnix, Akur8	Tesora Frontier models, in your format
Turnaround	☐ Weeks to months, in their queue	☒ Quick drafts, still checked by hand	☒ Fast and repeatable once it is live	☒ Minutes to days, in your workflow
Setup & fit	☒ A fresh engagement scoped each time	☒ No one knows your book better	☒ Heavy implementation on their platform	☒ 60-day build in your VPC, on your own data
Your raters & filings	☐ Generic deliverables in their template	☒ Your format, rebuilt by hand each time	☒ Rebuilt inside their system, their way	☒ Your raters, versioned and ready to deploy
Source & audit	☒ Independent, credible workpapers	☐ No source to trace, and the answer drifts	☒ Logged inside the platform	☒ Cell-level citations, append-only log
Scope	☒ Whatever you scope and pay for	☒ One step at a time, gaps in between	☒ Pricing or reserving, rarely filing too	☒ Pricing, reserving, filing, and close in one place

☒ Full capability ☐ Gap

A team built at the intersection of frontier AI research and decades of actuarial experience, **the two disciplines this problem demands.**

☆ Proud sponsors of CAS

Above all, we want to help you **win**.

We are a thought partner first. This technology is powerful, and it only helps once it is opinionated: built with a real point of view on how the work gets done and defended.

We are here to push the frontier forward with the right partners, not to sell you a license. A law firm does the legal work rather than selling software to lawyers, and we hold ourselves to that standard: **we take ownership of the outcome, not just the tooling**. Every deployment starts with a proof of concept anchored on your own success metrics, and we work with your team to find where the workbench sets the shared standard first.

Let's set up a call

sales@tesora.ai

DE-RISKED BY DESIGN

- ✓ It runs in your own environment, in a dedicated tenant. No cross-tenant inference.
- ✓ Your rate plans, filings, and books are never used to train shared models.
- ✓ AES-256 at rest, TLS 1.3 in transit, and your own SSO.
- ✓ We clear your security review before any work touches a filing.

SOC 2 Type II. Independent auditors test our security controls in operation over a monitored period each year, not at a single point in time. SOX-aligned for carriers with public-company parents.

Appendix

Per actuary, the recurring month goes from **150 hours to about 60.**

Most of the month disappears into recurring work: the data pulls, the reconciliations, the model updates.

Tesora compresses that mechanical layer, so the hours come back as judgment rather than assembly.

~90 hours back per actuary, per month

A 2.5× blended throughput gain across the recurring month, with the same team and the same sign-off.

Smarter, not harder

Time freed for strategy and selections rather than assembly.

Unlock your actuaries

More products, more territories, and more actuarial capability from the same team.

Hours are per actuary and reflect a typical ~150 hour recurring workload within a roughly 160 hour month, with per-workflow gains from Tesora's engagement framework. Figures are modeled and confirmed against measured results during a build.

We run **on top of Claude**, and we are model agnostic.

The model is the engine, not the product. What an actuary needs around it is infrastructure: the data wired in, the workflow decided, the cost controlled, and the record kept. That is the part we build, and we build it for you.

We guide the model

A raw model answers anything, confidently. Ours is held to an actuarial method: fit frequency and severity separately, test against your own history, and stop to ask before selecting.

We wire the infrastructure

Your loss runs, policy systems, filings, and ledger are connected once and stay connected, so every study reads the same reconciled book. A chat window starts empty every time.

The workflow is opinionated

Reserving and pricing have a right order of operations, and we encode it. Chain ladder, Bornhuetter-Ferguson, and Cape Cod run side by side, so the selection stays your actuary's call.

We manage the cost

Running a real book through a frontier model naively is slow and expensive. Extraction runs on a small model, and the judgment calls go to the strongest one.

We exist to build **your actuarial infrastructure**, not to serve the models or ourselves.
When a better model ships, you get it. What stays is the system we built around your book.

We use the best models. You keep the value.

Every firm is working out its AI spend internally right now. Our team of AI researchers and former investors knows what these systems cost, and how to optimize model spend per business outcome.

Right model, right step

Each step goes to the model that gets it right for the least spend. Extraction runs small, judgment runs strong, and none of that routing is your problem to manage.

Our incentive is the outcome, not the token count

A model vendor is never going to tell you to buy less of what it sells. Our platform has to deliver the result, so keeping model spend down is work we have to solve for ourselves rather than work we are merely free to do. **You are never left at the mercy of a rogue agent burning through tokens.**

Latest models, always up

Your workflows, data wiring, and audit trail live with us, so the strongest model arrives without a migration or a new vendor. A system built in-house on one provider stops when that provider does. We route across them, so **servicing an outage is our problem rather than your stopped quarter.**

Context mapping

We map your data, formats, and quirks against the work they feed, so we know intimately which model fits where. That map deepens the longer we work with your team, and it carries across every upgrade.

Audits matter more, not less

Better models take on more complex work, which raises rather than lowers the bar on proving it. Every value stays cited and reproducible, and **the advantage compounds for whoever moves first.**
